Transport & WHS Regulations

Core WHS Compliance Mandates

This section outlines the statutory Work Health and Safety duties required during physical multi-jurisdictional node audits across Southeast Queensland local government areas.

	☰ Regulatory Act / Standard	☰ Compliance Requirement	☰ Automated Logging Trigger
1	Work Health and Safety Act 2011 (QLD)	Ensure safe transit and hazard minimization for field auditors traveling to regional distribution hubs.	Mandatory checklist verification before site deployment.
2	National Heavy Vehicle Regulator (NHVR) Regulations	Validate warehouse loading dock safety zones and vehicle clearway compliance at regional sectors.	Log spatial clearance failures inside the Master Regional Register.
3	Safe Work Australia – Fatigue Management Code	Enforcement of strict travel-time limits. Continuous driving must not exceed 2 hours without a structured rest break.	Flags any scheduled transit route estimation exceeding 90 minutes.

Transport Data Mapping Metrics

▼ Transit Hazard Classifications

- **High-Exposure Routes (Sunshine Coast / Gold Coast):** Long-distance transit corridors exceeding 80 km in single-trip length. These routes require pre-travel road fatigue validation logs and have dedicated `AUD-BRIS-02` senior auditor assignments to balance exposure.
- **Short-Exposure Routes (Ipswich / Moreton Bay):** Local regional node transits under 45 minutes or 45 km. These are monitored primarily for local traffic congestion anomalies and route efficiency optimization.

▼ GRC Systems Integration

- **Data Validation:** Estimated transit distances and durations are pre-calculated before field dispatch. If a route's parameters mismatch the historical baseline safety thresholds logged in our system (e.g., a sudden detour spiking an Ipswich route past safe operating hours), an exception alert is generated.
- **Audit Trail:** Completed logs are cross-referenced with your automated Python pipeline outcomes to guarantee that every data file generated corresponds directly to a safely executed field audit run
